

Dmitrii Lemin

Senior Frontend / Full-Stack Engineer · React · TypeScript · Node.js · Building LLM-powered systems

leminds@gmail.com · github.com/lemind · linkedin.com/in/dmitrii-lemine-45013858 · t.me/Lemind

Senior engineer with **10+ years of frontend** (React, Next.js, TypeScript) across fintech, trading, and enterprise — including team leadership and 0–1 delivery — and **hands-on full-stack experience** in Node.js/NestJS. Currently extending into **LLM engineering**: built and shipped Biassemble, a production reasoning-audit system (TypeScript core + Python RAG engine) with measured evaluation discipline — golden datasets, CI-gated quality metrics, versioned prompts.

FEATURED PROJECT — BIASSEMBLE (LLM REASONING-AUDIT SYSTEM)

Solo-built, production-deployed system that detects cognitive biases in personal stories with **verbatim evidence binding** — every finding must quote the source text (schema-enforced, Zod), and “no bias found” is a first-class result. Three retrieval architectures in two months, each transition forced by a measurement.

- **Architecture**: TypeScript/Fastify orchestration core · Python/FastAPI retrieval engine · pgvector/Supabase · multi-provider LLM (Gemini, Anthropic, OpenAI) · 38-bias knowledge base with immutable content versioning
- **Retrieval R&D with receipts**: vector-only baseline plateaued at Recall@5 0.667 across four knowledge-base experiments; zero-shot NLI stage raised eval Recall@5 to 0.875; replaced by a hybrid (generative LLM U vector search) when NLI’s 67 s CPU latency proved production-unfit
- **Async architecture**: retrieval fires at story submission and runs inside the user’s 30–120 s question-answering window — 67 s of model latency made invisible without hardware changes
- **Evaluation discipline**: read-only golden datasets (positive/edge/adversarial/negative), CI-gated false-positive rate < 0.10 and evidence-grounded rate ≥ 0.90, threshold sweeps recalibrated per index version, live gap tracked openly (0.562 vs 0.85 target)
- **Shipped a fine-tuned selection model (LoRA on Gemma-3-4B)**: trained on 900+ synthetic + production-derived examples with cross-model verification; +71% relative recall and near-3× precision on the statistically meaningful held-out set (N=80), zero regressions — promoted to production after re-scoping the ship gate from a 4-sample metric to the 80-sample one, the more defensible call
- **AI-assisted workflow**: developed with AI pair tooling (Cline + DeepSeek/Qwen) treated as hypothesis generators — all architecture, evaluation design, and quality gates authored and owned by me; multi-model review quorum for every shipped artifact

SKILLS

AI / LLM engineering: RAG, embeddings + pgvector, zero-shot NLI, prompt engineering & versioning, evaluation design (golden datasets, Recall@K, FP gates), LLM orchestration (Gemini / Anthropic / OpenAI), structured outputs (Zod), Python, FastAPI, LoRA fine-tuning (QLoRA, PEFT)

Frontend: React, Next.js, TypeScript, JavaScript, GraphQL, Tailwind, CSS Modules, styled-components

State & data: TanStack Query, Redux Toolkit, MobX, Jotai, Recoil

Backend & APIs: Node.js, NestJS, Express, Fastify, PostgreSQL, MongoDB, REST

Testing: Jest, Testing Library, Vitest, Cypress

Architecture & practices: component-driven architecture, Feature-Sliced Design, performance optimization, SOLID, accessibility (a11y basics)

Tools & workflow: Git, Vite, Webpack, Docker, OpenShift, GitOps, CI/CD, Agile/Scrum; React Native, Cordova (mobile)

EXPERIENCE

Senior Frontend Engineer · Crypto Trading Platform · ~20 FE engineers

Mar 2025 – present

React, Next.js (App Router, SSR), TypeScript, GraphQL, Strapi, Node.js, OpenShift

- Owned the authentication and account domain (signup, KYC, 2FA, API keys) across critical platform flows; resolved NextAuth edge cases, preventing session loss during active trading
- Shipped the user-cabinet redesign, simplifying account flows and increasing signup→first-transaction conversion
- Built content-driven pages with App Router + SSR (Strapi), improving initial load; refactored core areas to Feature-Sliced Design
- Built and owned the internal admin panel (Radix + Refine, 6+ pages); extended backend in Node.js; managed feature flags and env config via OpenShift/GitOps

Senior Frontend Engineer · Trading Platform · 8–12 FE engineers

Dec 2023 – Feb 2025

TypeScript, React, React Native, TanStack Query, Jest, styled-components

- Delivered features for a live trading platform, including investment-account opening flows directly supporting conversion to active investors

- Applied a custom TanStack Query DSL unifying server/client state; standardized API interaction patterns across the team
- Implemented responsive redesign of key flows; maintained Jest/Testing Library coverage on critical paths; contributed React Native features

Senior Frontend Engineer · Swift Inventions (Vierally / ProprOffr / MeeSmartWallet) · 3-4 engineers *Dec 2022 – Nov 2023*

TypeScript, React, Tailwind, Vite, Jotai/Recoil, NestJS, PostgreSQL, Astro, Stripe

- Built frontends from scratch across three startup products; delivered MVPs from concept to release for early product validation
- ProprOffr: core frontend for a real-estate auction MVP with a11y attention; contributed NestJS/PostgreSQL backend modules and Stripe integration
- Implemented list virtualization and rendering optimizations for data-heavy interfaces; established Vitest testing on Vierally

Team Lead / Senior Frontend Engineer · Jetlyn

Mar 2020 – Nov 2022

React, Redux Toolkit, Cordova, Jest

- Built an enterprise IT-request workflow frontend from scratch (complex multi-step approval flows); grew the frontend team from 1 to 3 engineers, owning task breakdown and code review
- Developed white-label banking apps for multiple clients; integrated SBP real-time payments; shipped Cordova mobile features

Earlier experience — frontend foundation

2006 – 2020

- Progressed from web development to modern frontend engineering: SPAs, marketplaces, admin systems; introduced Cypress e2e testing; migrated legacy stacks to modern architecture; code review and mentoring

EDUCATION & COURSES

B.Sc. Computer Science — Penza State University, 2001–2006

Generative AI / LLM engineering coursework (Coursera, IBM et al.) — incl. Generative AI Applications with Python, LLM Architecture & Data Preparation, Language Modeling with Transformers, Prompt Engineering, Python for Data Science & AI

Languages: English — professional working proficiency · Russian — native
